

Typical tests in Pathophysiology

IV semester module No. 14 Environment and Health

//// One of the most common diseases caused by tobacco consumption is:

/// Connective tissue diseases

// Atherosclerosis and its important complication - myocardial infarction

///Diabetes mellitus

/// Urinary system diseases

//// The effect of alcohol on the intestinal microflora may cause:

/// Suppression of endotoxin release from bacteria

/// Decreased release of cytokines from circulating macrophages

/// Disruption of bilirubin conversion in intestines

// Enhancement of endotoxin release from bacteria

//// Heat stroke develops:

/// Suppression of the work of the heart due to the strengthening of the sympathetic influence on it

/// Polyuria

// Oliguria

/// decrease in blood viscosity

//// In the pathogenesis of kinetosis participates:

///Excitation of proprio- and mechanoreceptors

/// Tachycardia

///Excitation of the thermoregulation center

/// Strengthening of gastric secretion
